[Save this field](#)

[Add this form to my post](#)

A simple, utilitarian, form editor.

Simple to add.

All responses are saved on your blog,

and optionally emailed to you!

Automatic Spam Filtering (if you have Akismet active)

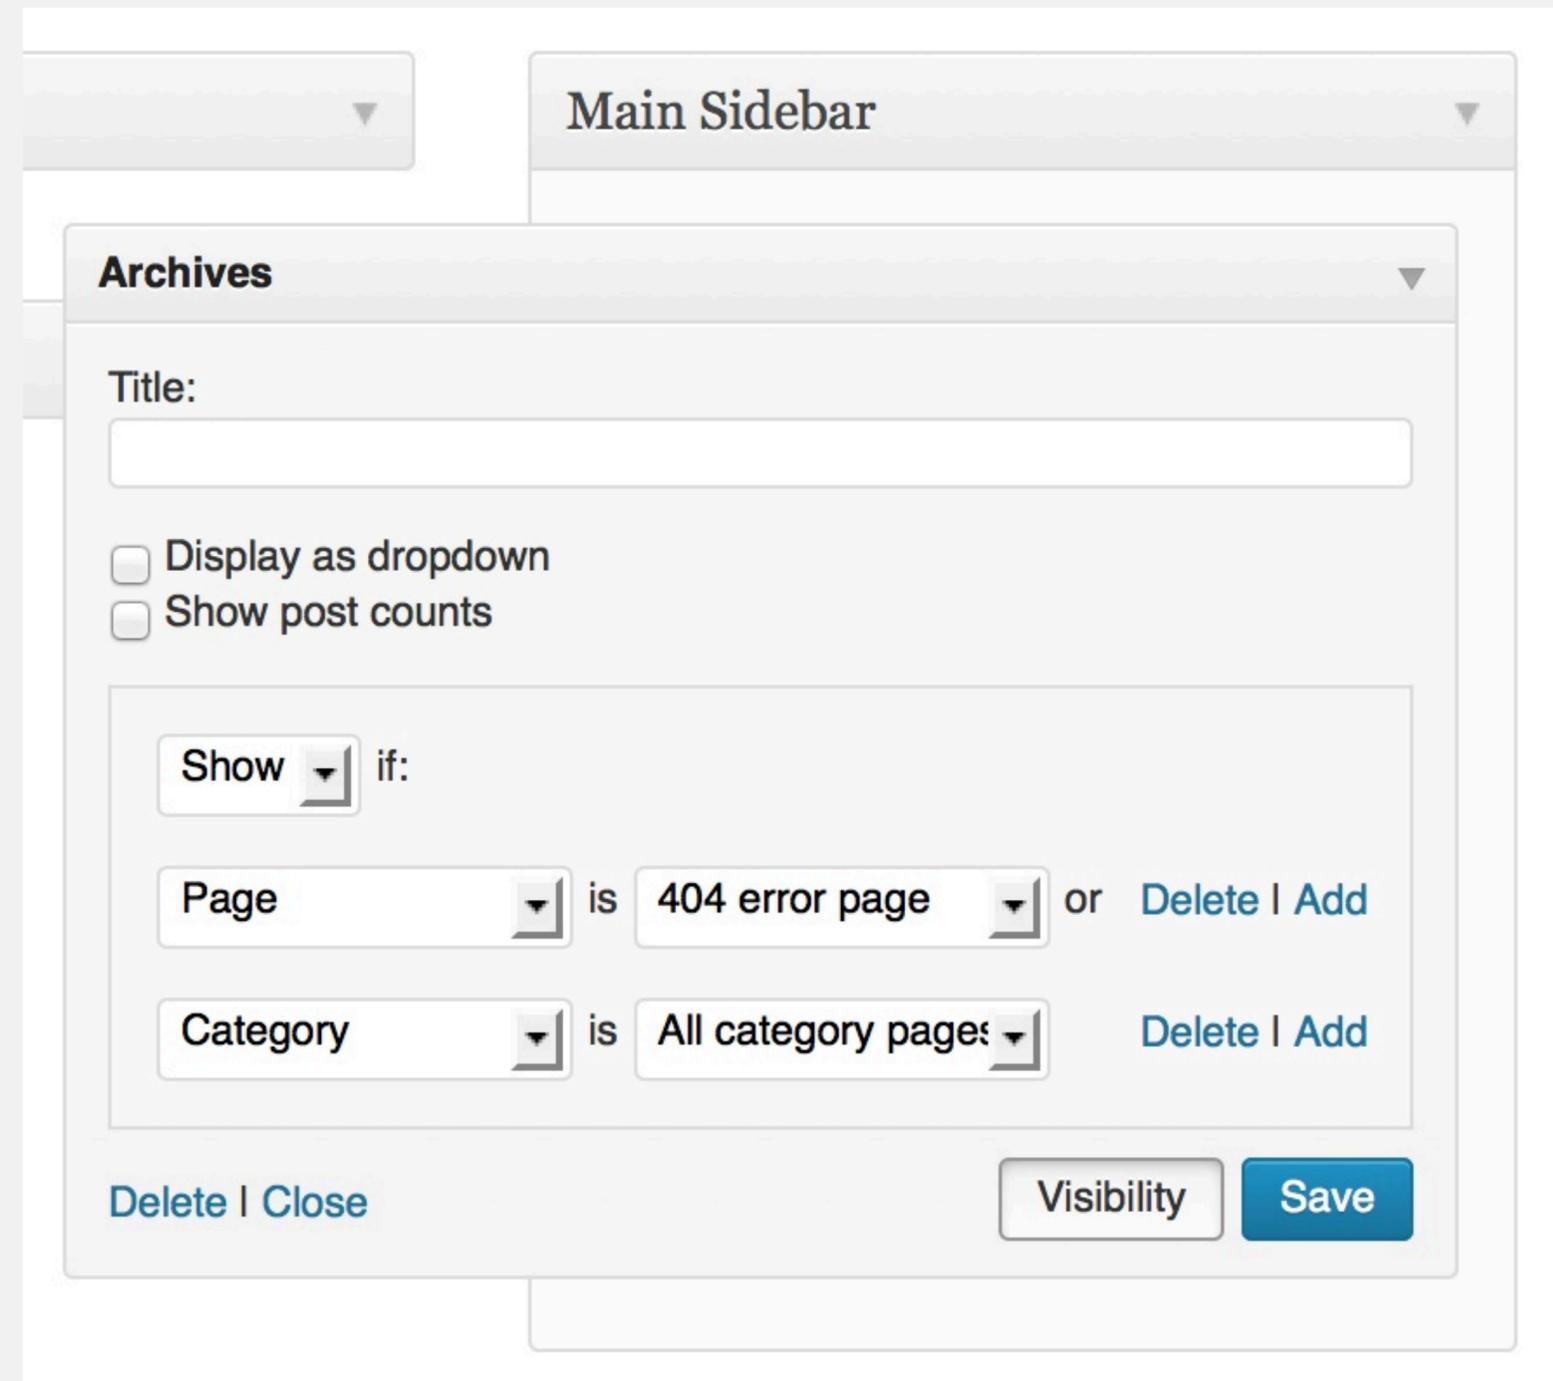

Easily customize your sidebar widgets.

Want your email signup widget only on your home page? No problem!

Want an 'About Me' widget only on single post pages?

Sure thing!

The screenshot shows the WordPress widget management interface. At the top, there is a dropdown menu for the sidebar, currently set to "Main Sidebar". Below it, the "Archives" widget is selected. The widget settings include a "Title" field, two checkboxes for "Display as dropdown" and "Show post counts", and a "Show if:" section. The "Show if:" section has two rows: "Page" is set to "404 error page" with "Delete" and "Add" links, and "Category" is set to "All category pages" with "Delete" and "Add" links. At the bottom of the widget settings, there are "Delete | Close", "Visibility", and "Save" buttons.

**George Stephanis:** You are commenting using your WordPress.com account.  
( [Log Out](#) / [Change](#) )

Likes are a super-easy way to let folks acknowledge your content, without having to think of something witty to say.

It's easy, it's fun, and it increases engagement.

**Like this:**

**7 bloggers** like this.

# Publicize

Publicize lets you automatically post your new content to social media services when it's released.

Publicize uses WordPress.com servers to make sure you're never hurt by others capping your shared server's rate limit.

We also do the grunt work of updating how we call the services when they update their APIs.

**Facebook**

**Google+**

**Twitter**

**LinkedIn**

**Tumblr**

**Path**

Make it *easy* for your visitors to share your content.

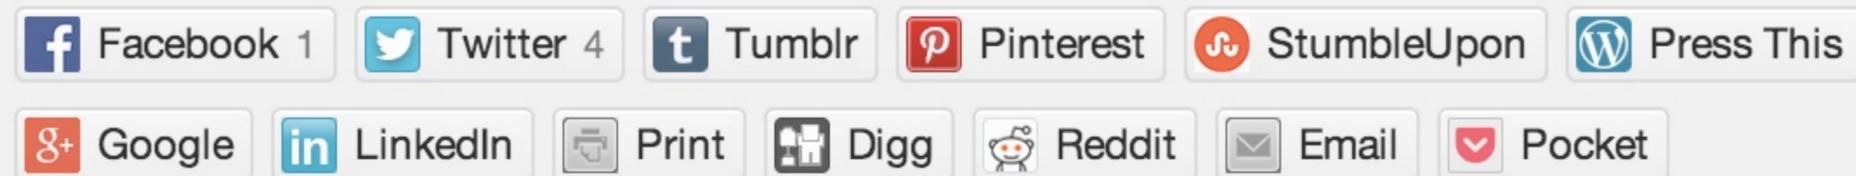

Select the services and order that you'd like to use through a simple drag-and-drop interface.

You can even add custom sharing modules.

Select whether you'd like to use the official sharing buttons,

or custom ones for a more consistent aesthetic.

**Share this:**

# Google Integration

Adds a Google sharing option, and details about the author's Google+ profile.

Adds authorship picture and details about the author to the Google Search Results.

Soon, will let you Publicize to Google+ (today on .com, soon in Jetpack)

## [WordPress Jetpack Review - Is Automattic's Plugin Worth Using?](#)

[wpmu.org/should-i-use-jetpack-on-my-wordpress-website/](http://wpmu.org/should-i-use-jetpack-on-my-wordpress-website/) ▼

by Harley Alexander - in 40 Google+ circles

Mar 4, 2013 - Do you need what **Jetpack** has to offer? Is it even worth installing? We analyze Automattic's popular plugin.

Let visitors get more context about your commenters by viewing an excerpt from their public Gravatar profile when hovering over their thumbnail!

Turn it on, and forget it.

No theme customizations, no work on your end.

Mobile Push notifications keep you up to date on the go in your iOS

or Android WordPress app.

Moderate comments on the fly and

keep up with your readers in real time.

Media

Carousel

Tiled Galleries

Photon

Extend WordPress native galleries so that viewing the images becomes an immersive, full-screen experience.

Let users comment on individual photos, or not.

Drop-in solution, but easily customizable if needed.

A beautiful way to display galleries of your content.  
Each individual image will be pieced together to form  
a single, beautiful whole.

Captions slide up as you hover over each image.

# Photon

Photon is a 100% free Image CDN.

Your web server can run much faster if it's not tying up connections by serving up so many megs of images all the time.

By caching the image on the WordPress.com cloud, we handle distribution for you!

The image URLs are swapped out in your content by a filter, so there's no changes in your database.

It's completely safe to deactivate at any time, and your content will serve from your own server again.

Get Idea → Publish Post → Be Happy

Post by Email

Spelling and Grammar

Shortcodes

Register an @post.wordpress.com email address, that can publish directly to your blog!

Send in file attachments, use special shortcodes for categories, tags, delaying your post, polls...

This is a terrific way to interface with external web services that you'd like to auto-publish securely!

# Spelling and Grammar

When you're writing a post and want to make sure you've caught all the grammar and usage errors, or aren't sure if you've misspelled something, Spelling and Grammar

hooks into [afterthedeadline.com](https://afterthedeadline.com) to check for you!

Publish more readable, syntactically correct content for your readers.

A **shortcode** is a WordPress-specific code that lets you do nifty things with very little effort.

Shortcodes can embed files or create objects that would normally require lots of complicated, ugly code in just one line. **Shortcode = shortcut.**

Jetpack Shortcodes add in some special shortcodes that are available on WordPress.com

**[archives]** **[googlemaps]** **[twitter-timeline]** **[scribd]** **[bandcamp]** **[slideshare]** and more!

We've just added in the **[presentation]** shortcode for offering dynamic presentations on your site!

Search ALL THE THINGS

Omnisearch by default will search your Posts, Pages, Comments, Media Files, Jetpack Contact Form Feedback, available Plugins, and anything else that a plugin wants to offer results for.

It's made to make your life easier, and is *only* in the WordPress admin.

It's also (probably) coming to Core in 3.8 this December.

(We're in the midst of running advanced usability tests to make sure it's a worthwhile addition)

(It is)

Notifications add an item to your adminbar that notifies you when something's happened on any of your networked sites.

You can reply to a comment right from the notification area.

It's super awesome.

## Mobile Theme

The mobile theme is an easy way to add a phone-friendly version of your site.

It's just a bundled version of the Minileven theme

<http://en.blog.wordpress.com/2011/11/02/new-mobile-theme-minileven/>

A responsive custom design is usually best.

But, if you'd like to get something quick out there to make life easier for

your visitors, give the Mobile Theme a go.

# Custom CSS

```
code {  
  color: red;  
  font: bold;  
}
```

Custom CSS lets you add in custom style rules for your site.

Instead of creating a child theme or modifying your theme's code directly, it lets you modify it safely.

It even uses revisions in your code, so you can always step back to a previous version!

It even compiles LESS and Sass for you, if that's your thing!

The Custom CSS is even enqueued cleanly, so it's cached by the

browser, instead of being echoed on every page load.

For themes that support it, Infinite Scroll will let your users scroll forever.

It even adds some neat tricks!

For example, when you scroll down to what *would* have been page 5, it **ninjas** your url to be **/page/5**

That means, once you navigate away and then come back, you're not kicked all the way back to the start and lose your place!
